Introduction

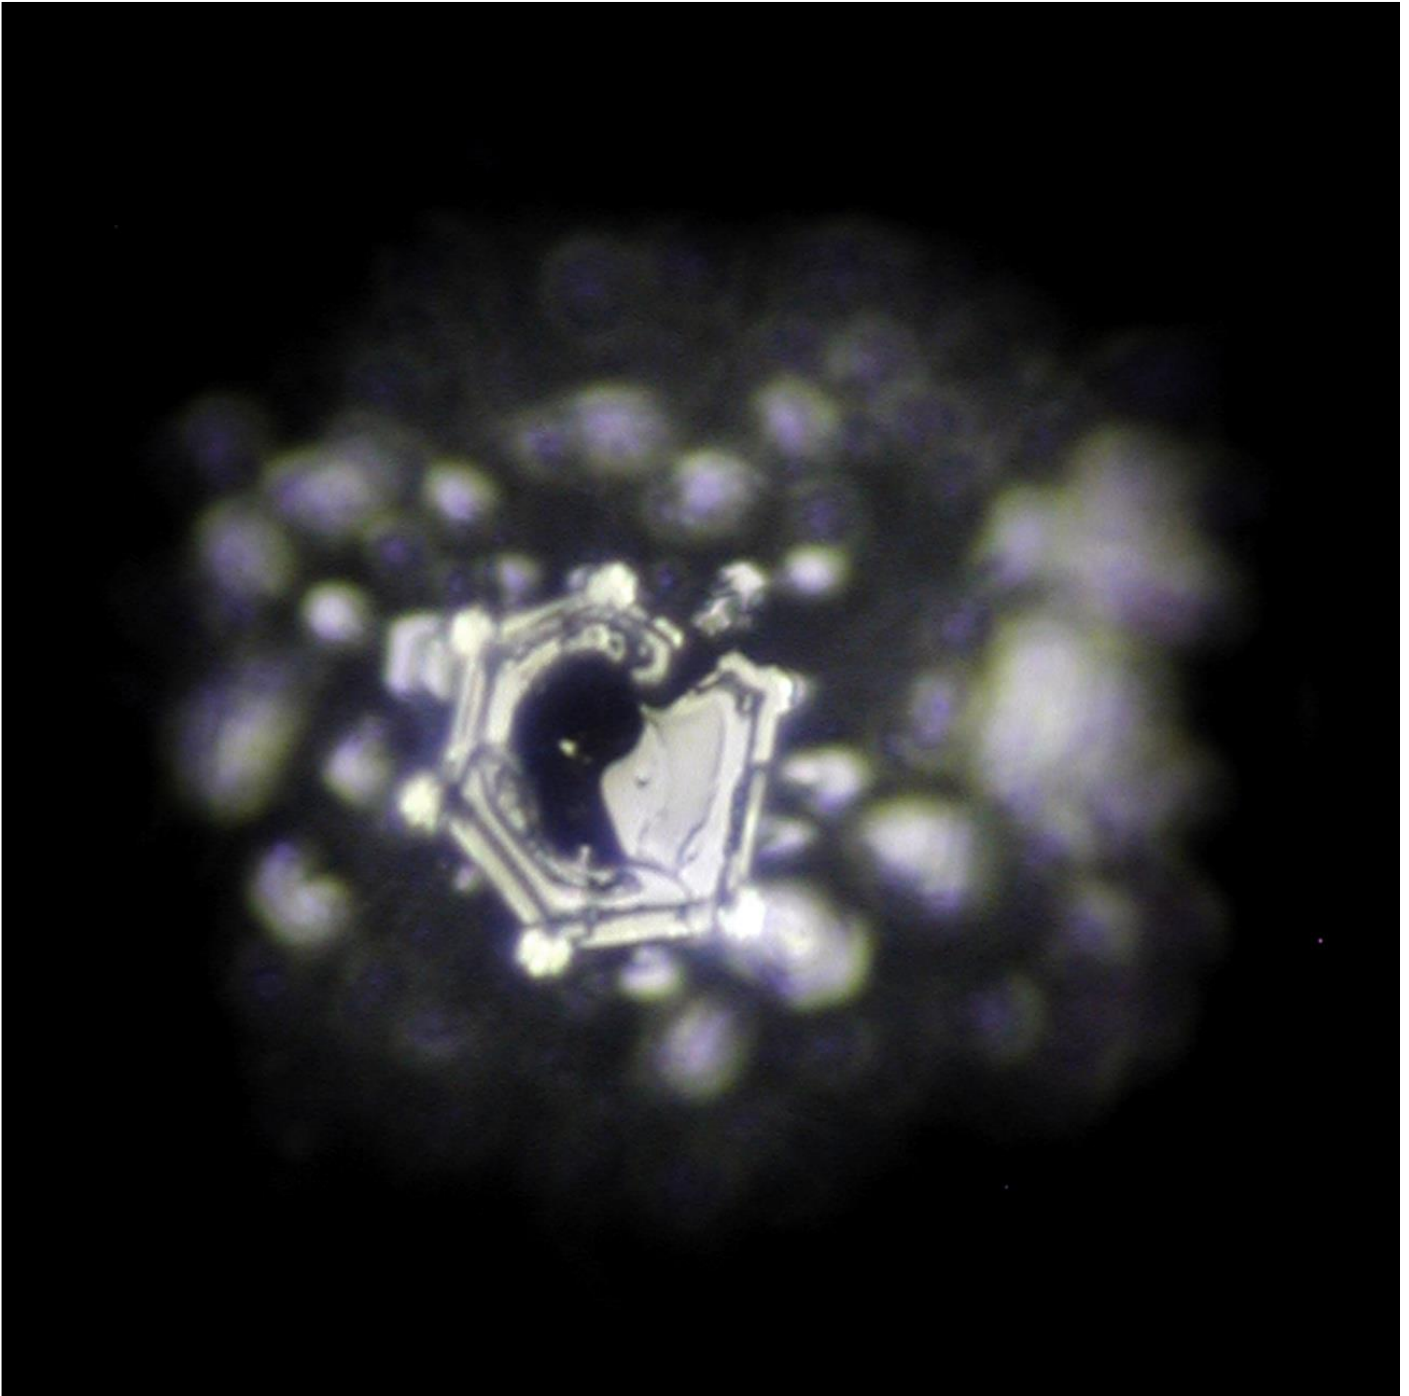

A Japanese word, Hado means “vibration”. “Hado is the intrinsic vibrational pattern at the atomic level in all matter. It is the smallest unit of energy.” Quantum physics today acknowledges that everything in the universe has a vibration, waves, and this includes living organisms. Energy of every living creature are unique, every substance emits its own information, a subtle vibration. There is no such thing as solid matter. And everything has its own combination of Hado frequencies that is as unique to it as a fingerprint is to a person.

Knowing that water can memorize information, Dr. Emoto developed a special method for photographing water crystals to successfully prove this theory. It involves presenting positive and negative words, music, or photo images to water, then freezing the sample and photographing the results.

TEST RESULTS

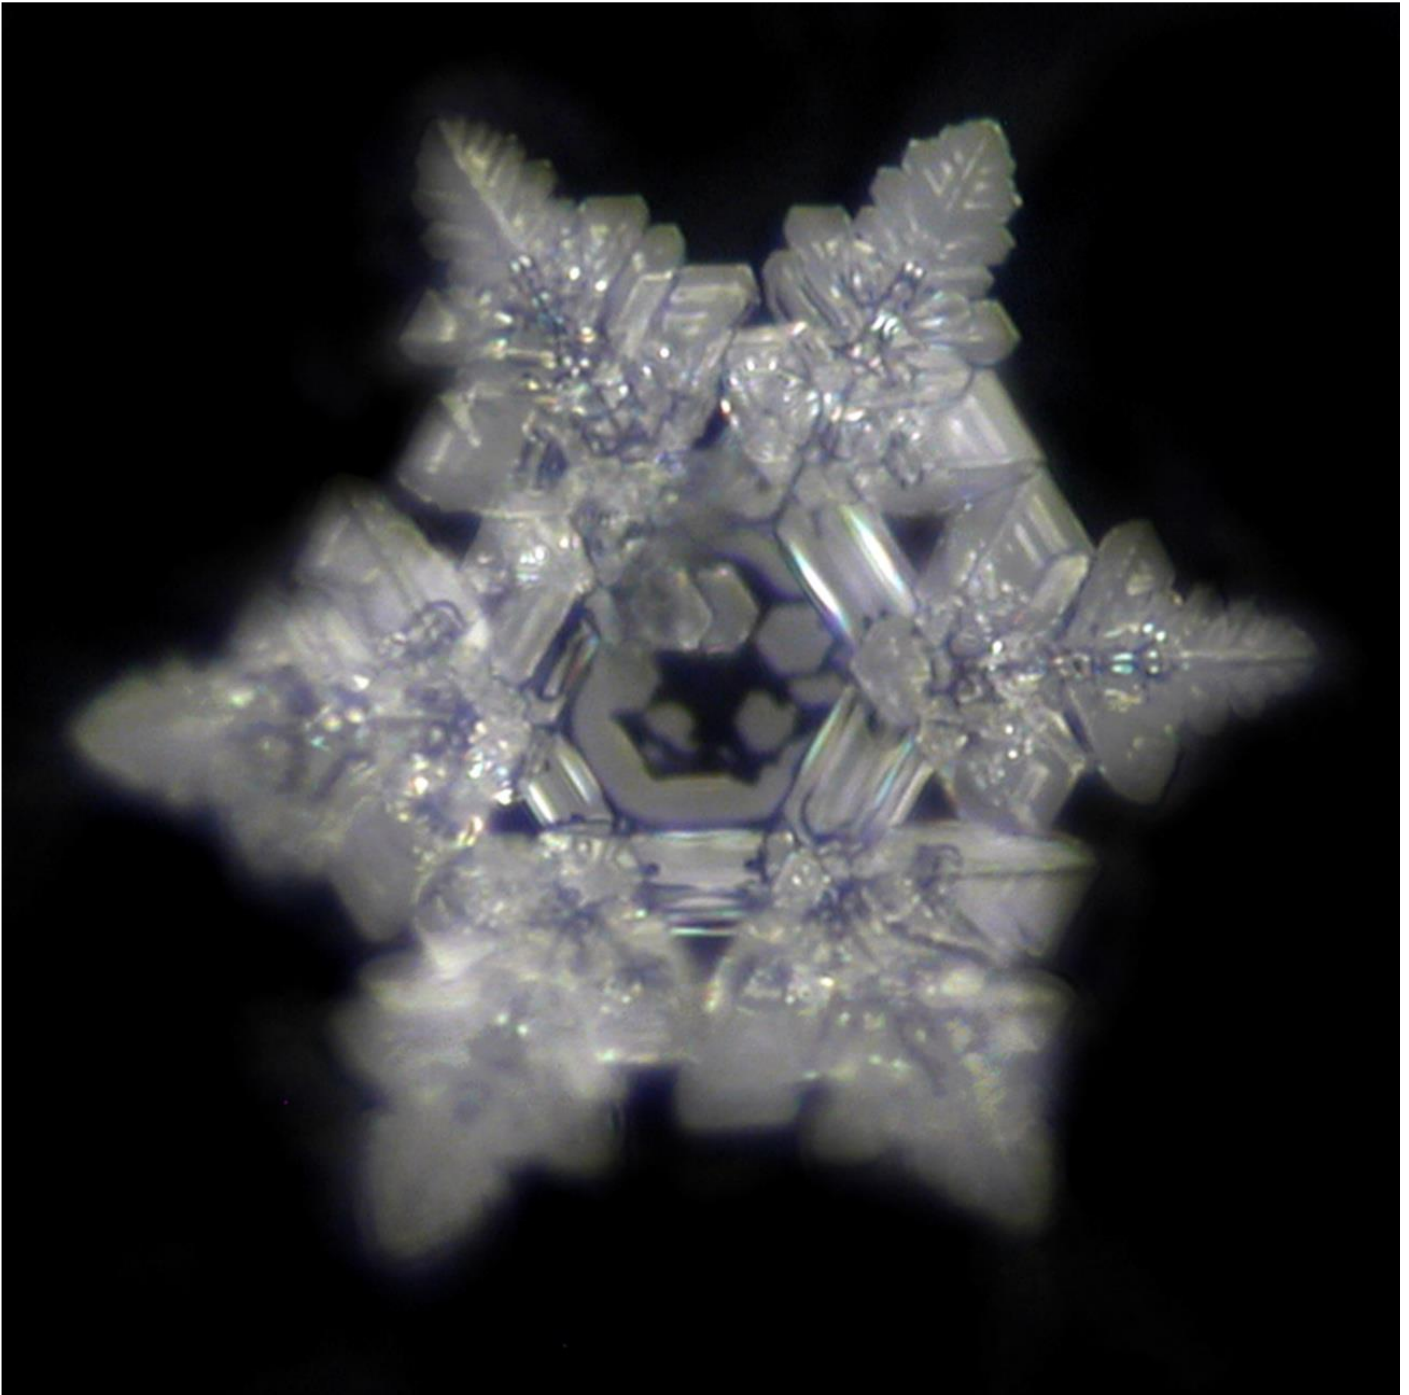

Water drops from distilled water have been frozen and photographed digitally under the microscope. To visualize "energies", a water is used which is barely able to produce crystalline forms on frozen drops.

RESULT

Photographing water crystals shows base water - "distilled water". The shape on the top was considered significant for base water.

The i9 bottle (Chakra Rainbow) has been filled with this distilled water for 2 hours. Afterwards the water drops have been frozen and photographed digitally under the microscope. The crystal shows the change of shape.

RESULT

The crystal photo of i9 Bottle shows the significant change of shape in water crystal.

CONCLUSION:

Photographing water crystals shows significant positive changes in the vibrational pattern of water from i9bottle.

The research was led by independent experts:
Sarah Steinmann
